Wageningen Marine Research

## Abstract

Dit is een geïllustreerd rapport over de 81 Noordse Stormvogels die in 2021 in Nederland werden onderzocht in het kader van het monitoring programma van plastics in hun magen. Zulk onderzoek maakt deel uit van het internationale programma dat metingen verricht aan de voortgang naar de zogenoemde 'Goede Milieu Toestand (GMT)' in de Europese zeegebieden. Volledige studieresultaten worden in jaarlijkse formele onderzoekrapporten gepubliceerd.

*This is an illustrated report on the 81 Northern Fulmars investigated in the Netherlands in 2021 for the monitoring program of plastic particles in their stomachs. This research is part of the international program that measures progress towards the so-called 'Good Environmental Status (GES)' in European marine waters. Full study results will be published in a formal research report.*

(see next page for English text)

Dit document beoogt onze project-vrijwilligers en andere geïnteresseerden te informeren over de verzamelde Noordse Stormvogels voor ons graadmeteronderzoek van plastic in de magen. Deze lange termijn monitoring wordt uitgevoerd in opdracht van nationale en internationale overheden om wetenschappelijke informatie te verschaffen over de huidige situatie en ontwikkeling van plastic zwerfvuil in de Noordzee. Deze update (nr 8) betreft de 81 Noordse stormvogels gevonden in Nederland in 2021.

Niet alle ontvangen vogels hadden een maag, maar we blijven benadrukken, dat we liever zo nu en dan een vogel met incomplete of ontbrekende maag op de snijtafel hebben, dan dat er bruikbare stormvogels op het strand blijven liggen! Dus blijf s.v.p. ook oudere viese kadavers verzamelen zolang je het enigszins mogelijk acht dat de maag nog aanwezig is. Laat een dode stormvogel alleen maar liggen als het echt zeker is dat maag e.d. ontbreekt.

Om het verzamelen van oude stinkende kadavers iets minder onaangenaam te maken, hebben we op 15 april 2021 een bericht op ons dossier [www.wur.nl/plastics-stormvogels](http://www.wur.nl/plastics-stormvogels) geplaatst met een filmpje met een handleiding hoe je viese vogels toch met schone handen kunt verzamelen. Het filmpje staat ook op YouTube [www.youtube.com/watch?v=7kzh8es7VGA](https://www.youtube.com/watch?v=7kzh8es7VGA)

Het rapport bevat voor iedere onderzochte vogel een pagina met detailinformatie en foto's van de maaginhoud. Dus er zijn ook pagina's voor de vogels zonder bruikbare maag of waar de maag geen plastic bevatte. Speciale pagina's kunnen zijn toegevoegd ter illustratie van andere opmerkelijke zaken. De meeste afkortingen op de individuele pagina's zijn min of meer vanzelfsprekend of ter plekke verklaard. Alleen de afkorting voor doodsoorzaak is misschien niet altijd duidelijk voor wat er aan de hand was. Daartoe geeft een supplement aan het eind van het document uitleg over gebruikte afkortingen.

We bedanken iedereen voor de steun aan dit onderzoek: niet alleen de mensen die de hier besproken stormvogels hebben verzameld, maar ook al diegenen die jaar in jaar uit voor ons op de uitkijk zijn en trouw met een plastic verzamelzak naar het strand gaan. De resultaten van al die inspanningen bepalen mede hoe het zwerfvuil-beleid van de Nederlandse en Europese overheden zich ontwikkelt.

Met veel dank voor alle hulp,

Susanne Kühn, Jan Andries van Franeker, André Meijboom en Oliver Bittner

---

## Nederlandse Samenvatting

Dit rapport is een geïllustreerde weergave van de hoeveelheid plastic in magen van Noordse Stormvogels (*Fulmarus glacialis*) voor de vrijwilligers in het monitoring programma. Voor iedere gevonden vogel wordt informatie kort samengevat en met foto's van maaginhouden geïllustreerd. In 2021 werden 81 dode vogels onderzocht, waarvan er zes geen bruikbare maag meer bevatten, en vier hadden voorafgaand aan hun dood langer dan drie dagen levend in een vogelasiel doorgebracht. Zij worden niet voor de trendanalyse gebruikt, omdat plastics uit de maag verdwijnen door slijtage of verbrokkeling. Maar zulke vogels verschaffen ons op de langere termijn mogelijk wel meer informatie over de snelheid van verdwijnen van verschillende soorten plastic uit de maag. Voor de monitoring analyse waren dus 71 magen beschikbaar.

Dit voor een enkel jaar vrij grote aantal vogels zette een in 2020 met 14 vogels begonnen toename van plastics door. Om onstabiele jaarlijkse veranderingen te ondervangen, wordt de 'huidige' situatie altijd beschreven als het gemiddelde over de afgelopen vijf jaar. In 2017-2021 werden 179 magen onderzocht, waarvan 94% plastics bevatte, en 50% meer dan 0.1 gram. Als internationale doelstelling geldt dat dit laatste percentage tot onder de 10% teruggebracht zou moeten worden. Onder de 179 vogels bevat de gemiddelde maag nu ietsje minder dan 26 stukjes plastic, met een gewicht van 0.25 g. Gemeten over de afgelopen 10 jaar is, na eerdere afnames, geen statistisch significante verandering meer waarneembaar.

Dear volunteers,

This document intends to inform our project-volunteers and others interested about the beached Northern Fulmars which they collected for the study of plastics in the stomachs. This long-term monitoring is commissioned by national and international authorities in order to provide scientific information about current levels of, and trends in the abundance of plastic litter found in the North Sea. This update is nr 8 for the Netherlands, providing information on 81 fulmars found during 2021.

We occasionally receive birds without a stomach, but these are also dealt with in this report because we aim to provide a full overview. Please note that we strongly prefer to receive occasional 'empty' old and dirty birds to avoid that any fulmar with stomach would be left on the beach! When in doubt, just collect the bird, and don't be disappointed if the occasional one proves to have no stomach.

In order to promote the collection of old and smelly corpses, on 15 April 2021 we have placed a message on our dossier [www.wur.eu/plastics-fulmars](http://www.wur.eu/plastics-fulmars) that contains a short video on how to collect a dirty bird with clean hands. The short video is also available on YouTube [www.youtube.com/watch?v=QvzadnYkapM](https://www.youtube.com/watch?v=QvzadnYkapM)

The report provides a separate information page with stomach content photos for each individual bird. Pages are also included for birds lacking a stomach or having a stomach without any plastic. Incidental additional pages may be provided to illustrate other remarkable issues. Most abbreviations used to provide information are fairly self-evident or directly explained. However, the acronyms for cause of death are sometimes less straightforward and are explained in the supplementary pages at the end of this document.

We thank all helpers, not only those who found a bird discussed in this report, but all the volunteers who year after year are on the lookout for fulmars suitable for our project. Your individual support represents an important contribution to marine litter policy decisions!

We are extremely thankful for your help,  
Suse Kühn, Jan van Franeker, André Meijboom and Oliver Bittner

---

## Summary

This document is an illustrated report for the surveyors in the monitoring program of plastics particles in stomachs of beached northern fulmars (*Fulmarus glacialis*). It contains short information and photos of stomach contents of individual birds. In 2021 a total of 81 corpses could be recovered, six of which contained no stomach. Four birds had been alive in rehabilitation for more than 3 days. Stomachs of such birds are not used for monitoring analysis because plastics, while the birds are in care, could be grinded and/or excreted fairly rapidly. However, with a sufficiently large number of such rehabilitation birds, we do hope to get some further insights in the speed of degradation of different types of plastics in the stomachs. Thus we had 71 stomachs that were used for monitoring.

This large annual sample continued an increase of plastics observed also in the small sample of 2020. To avoid annual variations between sometimes small annual samples, the 'current' in the fulmar monitoring program is described as the average over the past five years. Over the 2017-2021 period, we investigated 179 stomachs. Among these, 94% had plastic, and 50% contained more than 0.1g of plastic, whereas the international aim is that the latter percentage must be reduced to under 10%. Among the 179 fulmars, the average stomach contained a bit less than 26 plastic particles, weighing 0.25 g. Over the past 10 years, following earlier decreases, a statistically significant change can no longer be observed.

## Waar vind ik mijn vogel ? - *Where can I find my bird?*

Total mass of plastic in stomach (g)	

**NO STOMACH PRESENT**, so this bird could not be used for the plastic monitoring program. However, **please remember** that we ask you to also collect older decayed damaged corpses, as often these may still contain a stomach that contributes to our dataset. We prefer to occasionally receive birds without a stomach, rather than leaving potentially valuable material on the beach. Only leave fulmar corpses at the beach when you are absolutely sure that the full interior has been scavenged.

This stomach contained a large piece of balloon rubber (latex)  
 Latex normally starts to decay after rinsing, probably due to stomach enzymes  
 (see for example rubbery material in NET-2021-065).  
 In this case the material was stored in ethanol for some time  
 And was then dried to firm but rather brittle materials

## **Supplement individual details (acronyms)**

### **Supplement individuele details (afkortingen)**

*The ruler in photo's shows mm and cm scaling*

De lineaal bij de fotos toont mm en cm schaal

#### **CEM = cementcloaca - cementcloaca**

*A blockage in the final part of the intestine by a 'hard' egg-shaped ball formed by accumulation of layer upon layer of hardened faeces and ureum. At some stage this completely blocks defaecation, the parts of the intestine above this fill up with digested mud that can't be excreted.*

Blokering van de einddarm met een steenachtige meestal eivormig bal van laag op laag opgehoopte uitwerpselen met ureum. Op zeker moment blokkeert dit de volledige 'stoelgang' en de voorliggende darm zwelt op met darmmateriaal.

#### **COL = collision – botsing**

*Collision is used when we observe signs of a mechanical death, e.g. broken bones, or internal heavy bruises. These may be caused by collisions with cables, wires, ship- or lighthouse lights, cliff accidents, and also roadkills. Collision may lead to instant death, but also to a slow starvation in birds being injured and alive, but unable to provide themselves with food.*

Botsing als doodsoorzaak wordt gebruikt wanneer er tekenen zijn van een 'mechanische' doodsoorzaak, zoals gebroken botten of zware inwendige kneuzingen. Dit kan ontstaan door botsing met kabels, draden, verlichting op schepen of vuurtoren, ongelukken op de klif, maar bv ook verkeersslachtoffers. Botsingen kunnen de onmiddellijke doosoorzaak zijn, maar kunnen ook leiden tot de hongerdood als een dier niet meer in staat is voldoende voedsel te verzamelen.

#### **DRO = drowning – verdrinken**

*This is used when the birds appear healthy, and in good body condition, except for bloodfilled or soaked lungs. These things suggest that the bird may have drowned instantly in surface nets. This could also be on longline hooks but without visible damage from the longline (see below).*

De term DRO wordt gebruikt als de vogel uitwendig en inwendig gezond oogt en in normale conditie is, maar waarbij bloed in longen of gesprongen aderen een aanwijzing zijn dat de vogel verdrunken is. Dat kan in netten zijn, maar ook door lange-lijn-visserij maar zonder zichtbare schade van haken of lijnen (zie hieronder).

#### **LLV = long-line victim Lange-lijn slachtoffer**

*A specific case of drowning or entanglement. Evidence showing that the bird drowned from longline hooking or entanglement, where birds are drawn down with the hooked line. This may be indicated by hook damage, often in the bill, or in the arm wing, in combination with good body condition, but e.g. fresh blood in lungs and burst internal veins.*

Dit is een speciaal geval van verdrinken en verstrikking en wordt gebruikt wanneer uit aanwezigheid van haak en lijn, of daarvoor typerende schade aan snavel of lijf duidelijk is dat de vogel is vastgeraakt aan een beaasde haak en mee onder water is getrokken.

#### **GUT = various internal problems**

##### **diverse inwendige problemen**

*This acronym is used for a range of problems observed during autopsy in the internal parts of the bird. This could be serious inflammations, e.g. in the oviduct of females, or serious kidney problems (granular obstructions); malformations, etc., or combinations of such problems. In the case of heavy cancers, the more specific acronym CAN Cancer is used. In general some details will be given under dissection notes.*

Deze afkorting wordt gebruikt voor een hele reeks inwendig geobserveerde problemen die als waarschijnlijke doodsoorzaak kunnen worden gezien. Dat kunnen zware ontstekingen zijn, bv in het vrouwelijk oviduct, nierfalen (korrelige structuur) misvormingen, etc. In het geval van grote kanker gezwellen wordt CAN Cancer als meer specifieke afkorting gebruikt. Veelal zal onder de dissectie notities wat meer toelichting worden gegeven.

## **PLU = plumage – veerkleed**

*In some cases, birds may have had problems in primary, tail or body feather moult, which has led to such poor plumage that difficulties in flying or water-proofing may be suspected causing excessive energy needs. In other cases, birds seem to suffer from problems with the down feathers, needed for insulation and additional water-proofing. Sometimes down is completely lacking, exposing bare skin immediately below the covers.*

Soms hebben vogels ernstige problemen met de rui van vleugel, staart of lichaamsveren. Dit kan tot een dermate slechte toestand van het verenkleed leiden dat gebrekkig vliegvermogen of waterdichtheid van het verenpak hebben geleid tot extreem energieverbruik en de honger dood. In andere gevallen kan de donslaag onder de dekveren slecht zijn of zelfs ontbreken.

## **OIL = oiling – Olie**

*Mineral oil in plumage is likely to have caused disrupted water-proofing of plumage or toxication.*

Aardolie vervuiling van het verenkleed heeft waarschijnlijk de dood veroorzaakt, door lekkage van de veren of vergiftiging.

## **EXT = other external plumage fouling**

### **andere uitwendige vervuiling**

*Substances other than mineral oils, such as vegetable or animal oils, paraffins or complex chemical mixtures may affect birds in similar ways to mineral oil.*

Andere substanties dan olie, bijv plantaardige of dierlijke olie, paraffine en chemische mengsels kunnen het verenkleed aantasten op een vergelijkbare manier als aardolie.

## **ING = ingestion – ingeslikte stoffen**

*Ingestion of materials is suspected to have caused the death of the bird, e.g. excessive amounts of paraffin or palmfat-like substances, but also extreme accumulation of plastics or other litter.*

Het opeten van bepaalde substanties kan soms aangewezen worden als de meest waarschijnlijke doodsoorzaak. Het gaat dan om bijv. extreme hoeveelheden paraffine-achtige of palmolie-achtige stoffen, maar ook om bijv. extreme ophoping van plastics of ander zwerfvuil.

## **STA = starvation – Verhongering**

*The bird died slowly from starvation, but it is unknown what has caused this. It may have been prolonged food shortage, but individual problems that cannot be identified during simple autopsies may also play a role. For example one may think of some diseases, undetected injuries, invisible pollution, poisoning or whatever.*

Deze term wordt gebruikt als de vogel totaal vermagert is, zonder dat duidelijk is wat dat heeft veroorzaakt. Dat kunnen ernstige voedseltekorten zijn, maar ook niet direct zichtbare ziektes of verwondingen, vervuiling, vergiftiging e.d.

## **UNK = unknown – onbekend**

*Used if we really do not have any clue as to what has caused the death of the bird, which may be the case especially in very old or heavily scavenged corpses.*

Dit wordt gebruikt als geen van de bovenstaande afkortingen bruikbaar is, bijvoorbeeld in het geval van extreem oude of totaal leeggewreten kadavers.
