# „Sinterglaszylinder“ as reference material for the measurement of WRCs and/or saturated hydraulic conductivity

- VitraPOR Sinterglaszylinder der Fa. ROBU
- Borosilicatglas 3.3
- 100 cm<sup>3</sup>
- Por. ASTM C (40-60µm)
- price 150€ (each)

Cylinder No.	Bulk density [g/cm <sup>3</sup> ]	Density "Borosilicatglas 3.3" [g/cm <sup>3</sup> ]	Porevolume [cm <sup>3</sup> ]
2240	1.457	2.23	34.65
2241	1.402	2.23	37.11
2242	1.426	2.23	36.06
2243	1.424	2.23	36.15
2244	1.432	2.23	35.78

# Measurement of WRC in the soil physics lab at „BGR“

---

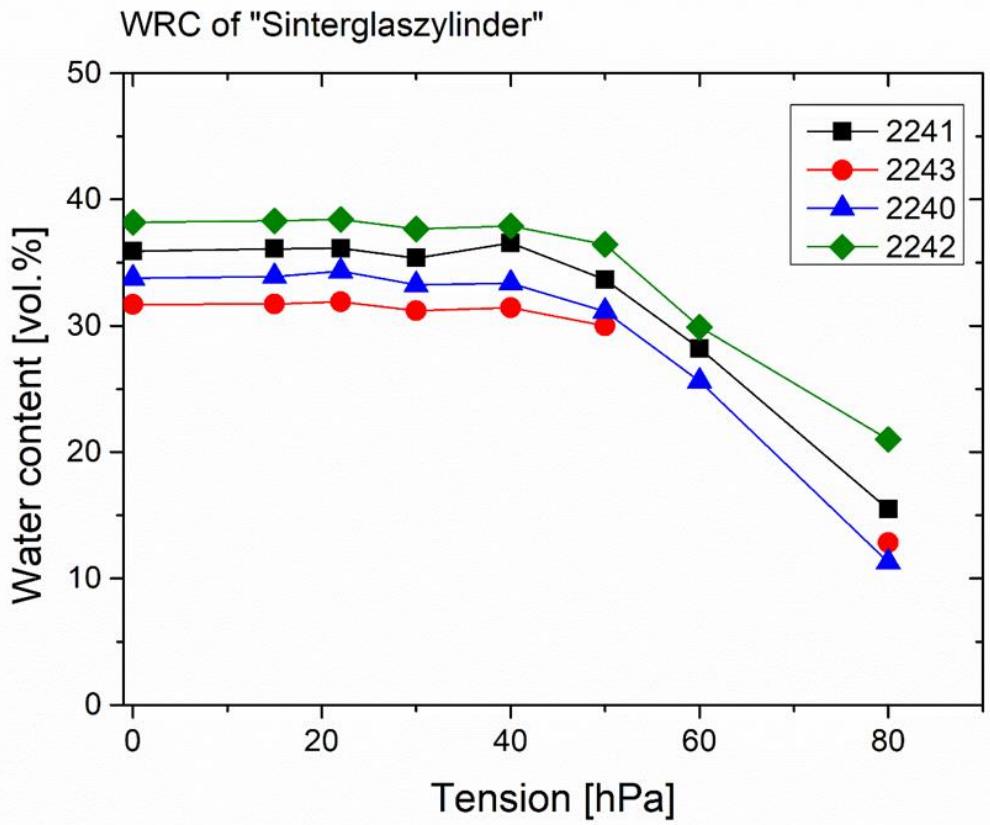

- “pF-Laborstation“ Fa. Ecotech

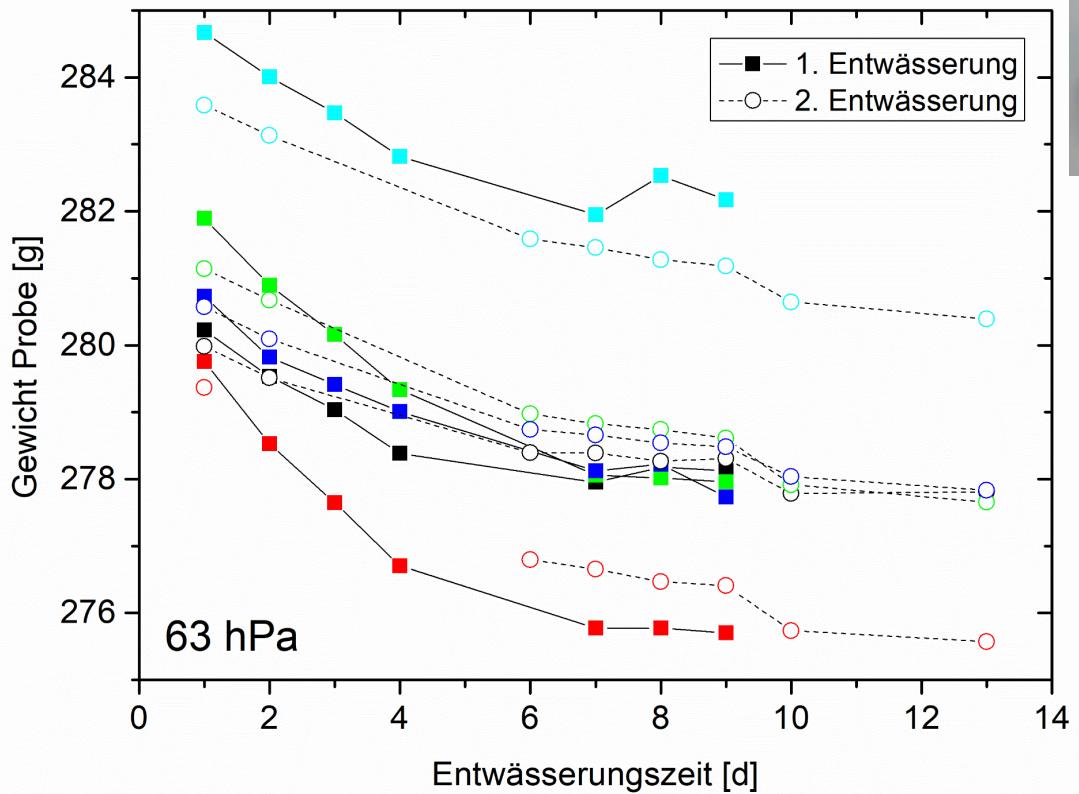

- 6 pressure plates / 3 pressure units
- Pressures (suctions) from 0 - -750 hPa (-312 hPa)

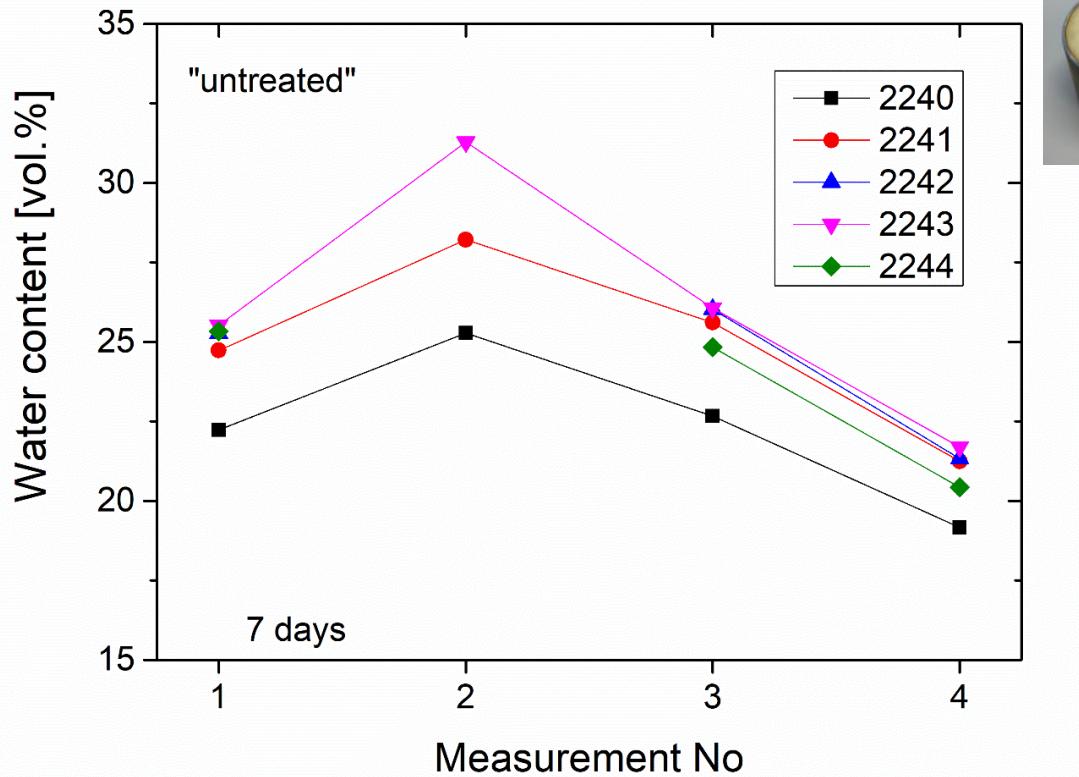

Bundesanstalt für  
Geowissenschaften  
und Rohstoffe

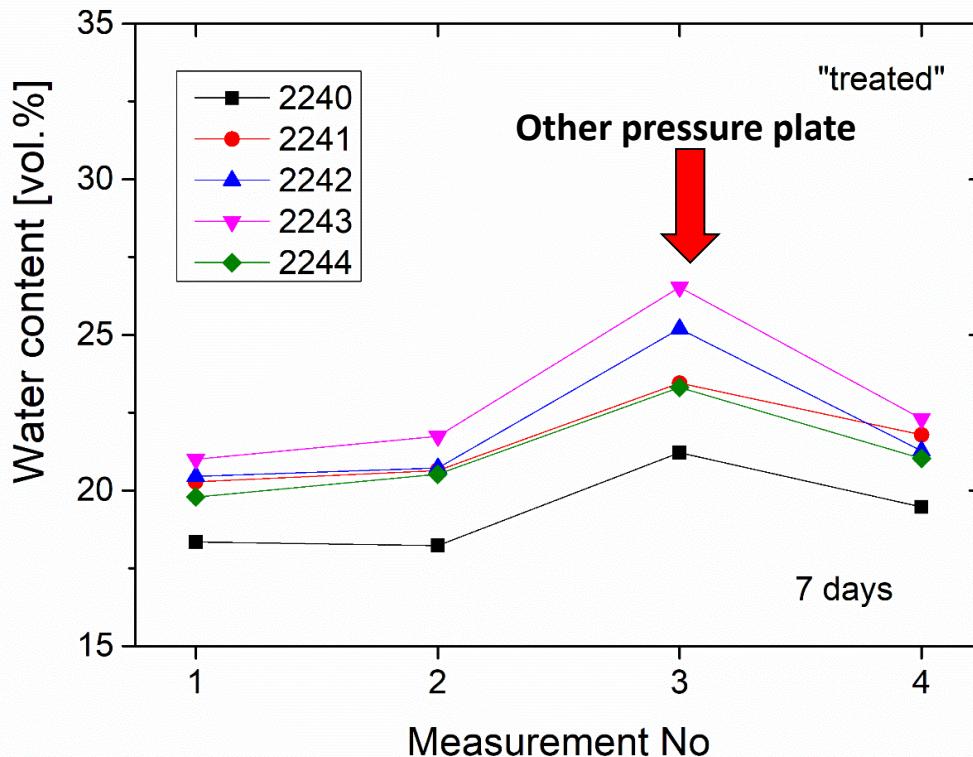

GEOZENTRUM HANNOVER

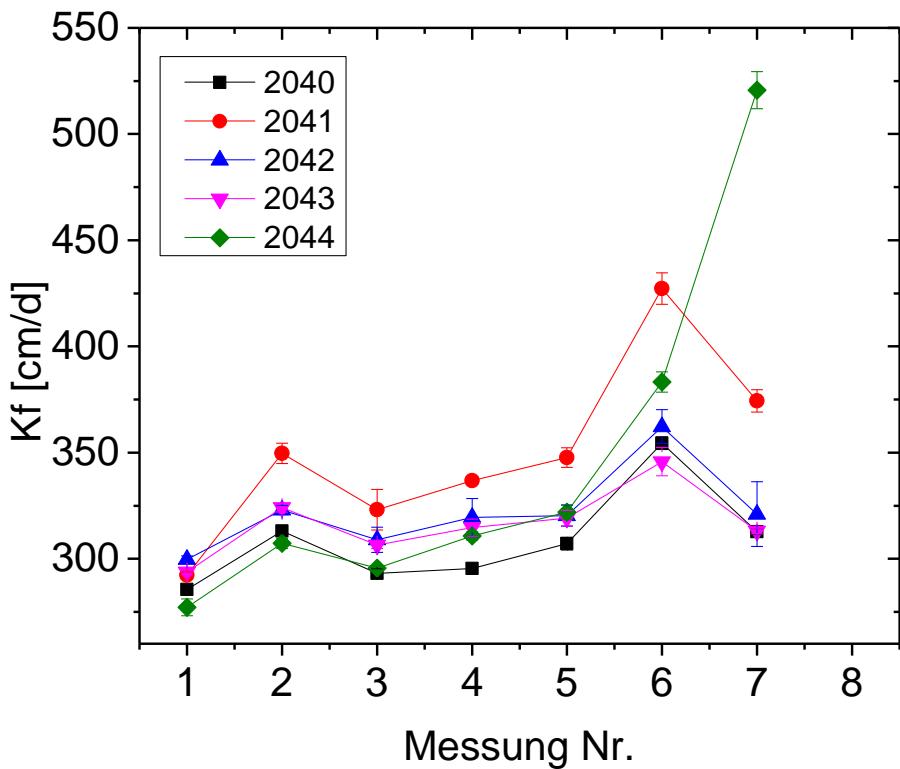

63 hPa

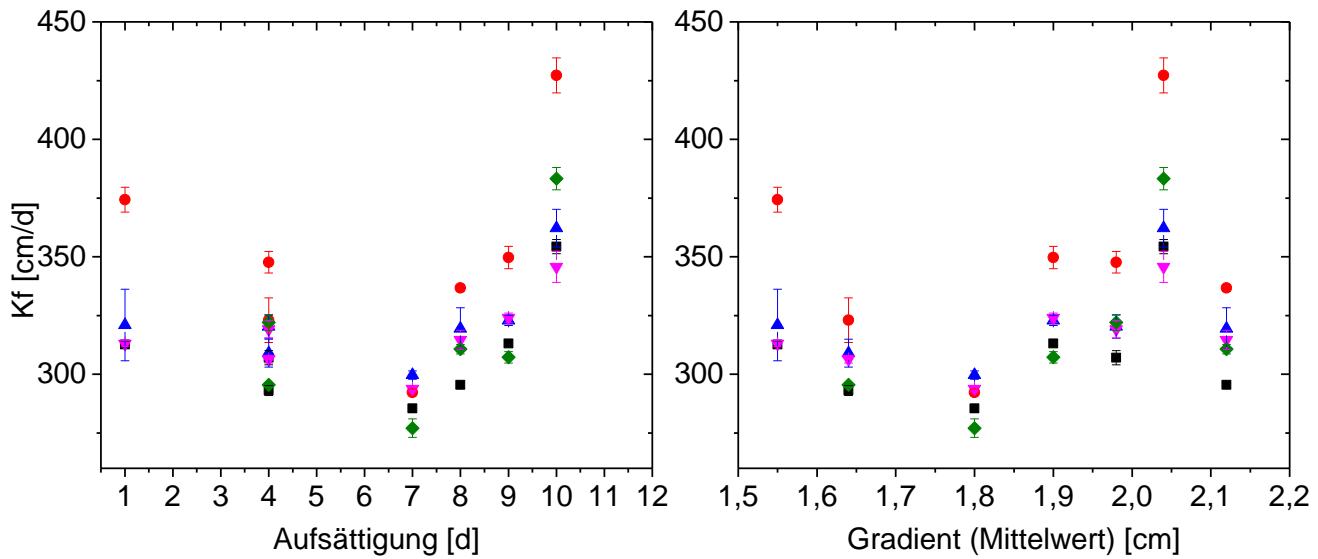

treated=washed  
in  $\text{H}_2\text{O}_2$  (1%)

63 hPa

# Measured saturated hydraulic conductivity Kf (Ks) of „Sinterglaszyylinder“

Permeameter  
Fa. Eijkelkamp (NL)

# Conclusions

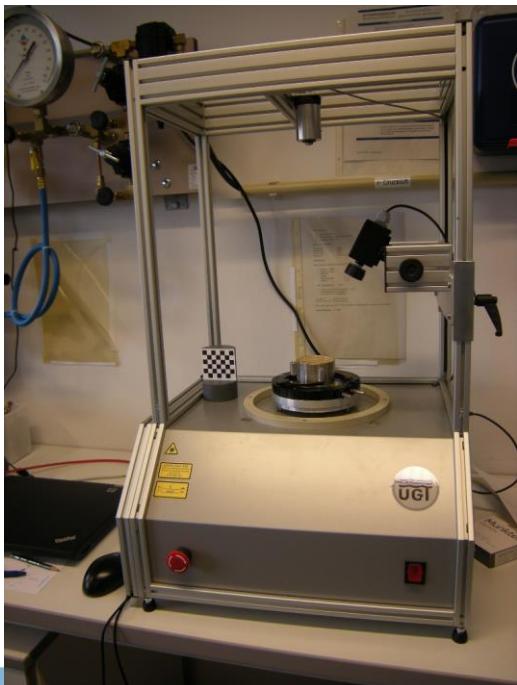

- Glass cylinders were tested as reference material for WRC (and Ks)
- Pore size distribution of cylinders shows highest sensitivity at 63 hPa
- Problem: high standard deviation (SD)
- But: maybe just the measurement device is responsible for high SD

# Conclusions

- Glass cylinders seem not to be useful as a reference for the measurement of the saturated hydraulic conductivity  
(but is a reference really necessary?)

We keep on testing...
